What is a wetland?
Wetlands are strategically placed to capture surface runoff and drainage water. They provide temporary storage for floodwater and reduce peak runoff-flow rates after storms. Additionally, they reduce nitrate-N concentration in water by 52% and filter out chemicals from pesticides and insecticides. Wetlands also serve as wildlife habitats for 190 amphibian species and 5,000 plant species.
**Financial Incentives of Wetlands**

The Iowa Watershed Approach provides 75% cost share for installing wetlands. See your Soil and Water Conservation District or Natural Resources Conservation Service for other cost share opportunities.

- Potential to lease land to hunters for additional income.
- The conversion of wet or low yielding areas into wetlands can make economic sense.

**Wetlands and Flood Reduction**

1. Provides floodwater storage.
2. Reduces peak water flow rate after a storm event.
3. Recharges groundwater through the bottom of the wetland.

Wetlands intercept precipitation runoff and runoff is slowed compared to traveling straight across the landscape. With temporary storage provided in wetlands, the timing of flood peaks is delayed. Seepage through the bottom of the wetland converts surface water into groundwater.

**Wetlands and Water Quality**

1. 52% reduction in nitrate-N.
2. Reduces sediment loss and serves as a particulate phosphorus sink.
3. 76-84% atrazine retention.
4. Greater than 52% removal of certain insecticides.

Denitrification – microorganisms convert nitrate to N₂ gas which makes up 80% of the atmosphere. Wetland design is typically shallow to promote denitrification. Slower moving runoff produces less soil erosion. The phosphorus-laden sediment that travels with surface runoff is deposited in the wetland as runoff is slowed down. Chemicals found in pesticides and insecticides are filtered out of runoff and drainage water with wetland biota.

**Additional Benefits of Wetlands**

- Provides wildlife benefits:
  - Creates habitat and increases bird populations, including waterfowl, grassland and shore birds.
  - Increases migration corridors for migratory creatures.
  - Provides an opportunity to seed pollinator species in wetland buffer.
- Offers recreation opportunities, such as hunting, trapping and bird watching.
- Improves the aesthetic beauty of the landscape.
