with help from Ann Staudt, Aaron Andrews and John Lundvall

Editing and layout by Carol Brown and Ann Staudt

This project was funded by the Iowa Department of Natural Resources, USEPA (Section 319) and the Iowa Learning Farms. The Iowa Learning Farms program, initiated in 2005, is a unique partnership of farmers, state and federal agencies, conservation groups, the research community and the general public. Iowa Learning Farms is building a Culture of Conservation, taking a grassroots approach to develop innovative ways in which all Iowans have an active role in keeping our natural resources healthy. For more information about Iowa Learning Farms, visit our website: [www.extension.iastate.edu/ilf](http://www.extension.iastate.edu/ilf).

### ***Acknowledgments***

This toolkit was developed with the cooperation of the following watershed improvement groups: Silver Creek, Yellow River Headwaters, Badger Creek Lake, Hickory Grove Lake and Black Hawk Lake. These groups, along with their watershed coordinators, allowed us to test the effectiveness of different components of the toolkit. Their participation makes this toolkit a practical and proven means of conducting watershed-based community assessments.

Thanks to Iowa Learning Farms staff and student interns who worked with the watershed coordinators to test the different community assessment components: Elizabeth Juchems, Ellen White, Nathan Stevenson, Sara Sloan, Brittney Carpio and Patrick Kelly.

Special thanks to Allen Bonini and Stephen Hopkins for their recognition that we need to address the human/sociological dynamics if we hope to solve water quality problems.

## What is a Watershed-Based Community Assessment?

**A** community assessment is a description of a community and its people. The purpose is to identify the needs of a community in order to provide services appropriate to those needs. A watershed-based community assessment is a description of the people who live within a watershed. The goals of a watershed-based community assessment are to identify the water quality knowledge of the people, determine the concerns they face and weigh citizen enthusiasm for implementing a watershed improvement project.

A straightforward way to estimate the knowledge, needs and will of a community is to simply ask residents their opinions about water, their understanding of water quality, their satisfaction with water quality in their area, and the methods that could best be used to increase their scientific knowledge of water quality and build their capacity to participate in an improvement plan.

Assessing your watershed community's strengths and weaknesses is an important first step in planning and implementing an effective watershed improvement project. By taking the time to learn about your watershed community's issues, your group can discover new opportunities for increasing community involvement and individual commitment that will help ensure the overall success of your watershed improvement project. Without citizen "buy-in" to your watershed plan, it doesn't

*Without citizen "buy-in" to your watershed plan, it doesn't matter how much funding or technical support you may have, your project will not be successful.*

matter how much funding or technical support you may have, your project will not be successful.

The following is a guide on how to conduct a watershed-based community assessment for your area. Most community watershed projects, funded by the Iowa Department of Natural Resources (IDNR) and Iowa Department of Agriculture and Land Stewardship (IDALS), hire coordinators who have technical expertise to address the water quality impairments. Many of these coordinators are asked to conduct community assessments, outreach and education despite a lack of sufficient training and/or background in social science research and communications.

While the IDNR and IDALS have the capacity to advise and train the coordinators in assessing water quality and implementing technical solutions, expertise is lacking to train these coordinators in building watershed coalitions using community assessments. This guide has been developed for watershed coordinators, local leaders and Soil and Water Conservation District (SWCD) commissioners to better appreciate the value of watershed-based community assessment, to be able to conduct simple and effective community assessments without being social scientists and to develop a simple, locally-based watershed marketing plan based on data collected in the assessment. The final sections of this toolkit offer tips to holding successful watershed improvement outreach and education events. These tips are composite examples based on successful watershed projects in Iowa and experiences of the Iowa Learning Farms.

The 2011 Iowa Learning Farms publication *Water Quality Matters to Us All* revealed that local watershed stakeholders in Iowa are concerned about soil

and water quality, but in many cases there was no sense of urgency. All the groups represented in a series of soil and water quality discussions—farmers, non-farm residents, SWCD commissioners, and agency specialists—remained ambivalent about specific action steps. They were hesitant to suggest dramatic changes in production techniques that address natural resource concerns. In other words, unless the evidence is overwhelmingly in favor of change, status quo is reasonable and preferred.

To improve Iowa's water quality, we need to improve the environmental literacy of all Iowans. Community watershed groups and Soil and Water Conservation Districts are local frameworks in which to nurture this approach. Effective watershed-based community assessments allow watershed groups to develop goals, outreach and education regarding water quality challenges based on the values of the people living in the watershed.

*To improve Iowa's water quality, we need to improve the environmental literacy of all Iowans.*
